

Simplify your Allscripts EHR workflow

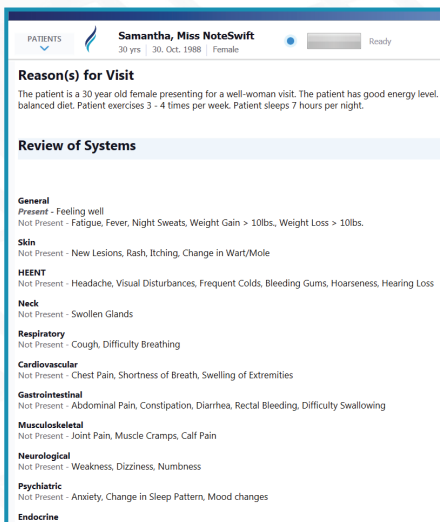

Samantha is a digital assistant designed to improve your EHR experience. Using any medical speech recognition software and our patent-pending artificial intelligence technology, Samantha uses automated intelligence to document the patient encounter accurately across all the screens in Allscripts Professional EHR™, in less than two minutes and at a fraction of the cost of your current workflow.

Samantha identifies the structured data from your narrative, automatically assigns coding, and seamlessly fills all the data fields as if the data was typed and clicked manually. By automating this process using Allscripts standard API interfaces, Samantha improves your EHR accuracy while saving you time and money.

Samantha is like having a real-time transcriptionist, scribe and medical coder in one - but without the costs and delays.

Samantha saves providers an average of 6-8 hours each week in EHR documentation time, giving them more time to focus on what's most important - providing outstanding patient care.

Samantha's New OnePage allows you to enter the entire note from a single screen

Samantha's new OnePage design makes it easier to create notes for new patients or to update and edit existing patient notes in seconds. Using all your own ROS and Exam templates has never been easier. When you want to apply a template, Samantha shows your list of templates, including previously applied templates so you don't have to remember them all. Once opened, the template contents are displayed without having to refer back to the EHR to determine which findings need to be modified.

Samantha simplifies and streamlines the EHR note entry process

Samantha lets you work the way you want to work. Simply type or dictate your patient encounter information and Samantha automatically completes:

- Reason for Visit
- History of Present Illnesses
- Review of Systems
- Allergies
- Past Medical History
- Social History
- Surgical History
- Diagnostic Studies
- Exam
- Assessment and Plan (including Orders)

Samantha improves accuracy and learns from physicians over time

Samantha improves accuracy by matching a physician's dictated terms with the proper equivalent in the EHR. Samantha identifies potential conflicts and ambiguous terms and automatically prompts the user to review and correct any potential conflicts. Samantha also learns from the user and will improve upon the tasks the physician most commonly performs over time - just like a transcriptionist, but in real-time.

Samantha is easy to deploy and learn

Samantha can be remotely implemented in 15 minutes and users can be trained in less than 2 hours. The intuitive OnePage interface ensures that Samantha is easy to use and quick to onboard. We will teach you how to use Samantha within your existing workflow and processes, so Samantha won't disrupt your routine.

Samantha helps your practice save money and reduce physician burnout

- Eliminates the need to work long extra hours to complete EHR documentation, helping to reduce physician burnout and create more free time.
- Reduces time spent on documentation, giving you more face time with patients and higher patient satisfaction.
- Enters billing codes accurately and intuitively, so your claims are submitted faster and denials are drastically reduced.
